[TUTORIAL] How to Debrick a BlackBerry PlayBook With an old BB10 Alpha

Hi, today i bring you a tutorial to debrick your blackberry PlayBook by installing an old BB10 Alpha. This method was originally suggested by [u/aLdroBSe](#) on [this post](#). Apparently all works, but be aware that we are installing a dev Alpha, so it is possible to encounter some bugs.

First you need the following files:

BB10 Dev Alpha: <https://archive.org/details/10.0.4.197-dev-alpha>

Darcy's BB Tools: https://archive.org/details/dbbt_20220712

Once you have this files downloaded these are the steps you have to follow:

1. Extract Darcys BB Tools and execute it.
2. Extract the BB10 Alpha files
3. On Darcy's BB Tools go build autoloader and select the contents of the BB10 alpha zip that you have extracted and create the autoloader. Once the process has ended the folder containing the autoloader should open automatically.
4. Once you have created the autoloader, plug your playbook to your computer and execute the autoloader, it should last around 5 to 10 minutes to install.
5. Once installed de BB10 Dev Alpha on yout playbook you have to press 1 time back and 2 times skip to bypass the contract part of the setup.

6. If you have done this correctly, now you should be on the BBID page, to bypass this we have to enter a random email and password, and then press back and skip.
7. Now you have ended the setup process, enjoy your Blackberry playbook :D

By default this dev alpha does not bring the default apps, you can download them here:

Default Blackberry Apps: <https://archive.org/details/2.1.0.1526-play-book-default-apps>
